

A) UHF-R cascading

1. UHF-R cascading vs. non cascading version

A 40-channel system (**UHF-R – non cascading**) requires at least 5 x UA845 to use a single pair of antennas, but allows to flexibly arrange receivers of any frequency band version in groups up to 5 receivers:

A 40 channel system (**UHF-R cascading**) requires only 1 x UA845, but requires that a stack of cascaded receivers are of the same frequency band version because of the Track Tuning Filter capability of the UR4:

Please note that the RF cascading (active circuitry) only works if the respective receiver unit is powered on.
